

Barkerville Gold Mines Cariboo PEA after-tax NPV at \$402.2M

[Barkerville Gold Mines {TSX.V: BGM}](#)

Released positive results from the independent preliminary economic assessment (PEA) prepared in accordance with National Instrument 43-101 at its 100-per-cent-owned Cariboo gold project, located in the historic Wells-Barkerville mining camp, British Columbia.

Mr. Chris Lodder reports

**BARKERVILLE GOLD MINES DELIVERS POSITIVE PEA FOR CARIBOO GOLD
PROJECT**

[Barkerville Gold Mines Ltd.](#) has released positive results from the independent preliminary economic assessment (PEA) prepared in accordance with National Instrument 43-101 at its 100-per-cent-owned Cariboo gold project, located in the historic Wells-Barkerville mining camp, British Columbia. The preliminary economic assessment provides a base case assessment of developing the project as an underground ramp access mine with a gold pre-concentration plant in Wells and gold processing in its existing upgraded Quesnel River mill. The preliminary economic assessment will be filed on SEDAR under the company's profile within 45 days of the date of this news release.

PEA HIGHLIGHTS

IRR	after	taxes	and	mining	duties
28.1%					
NPV	after	taxes	and	mining	duties
\$402.2-million					
Preproduction	construction	costs	(including	\$30-million	
contingency)			\$305.5-million		
After-tax	payback	period	(after	start	of operations)
3.1	years				
Peak-year			payable		production
206,000	oz				
Average		LOM		payable	production
185,000	oz				
Metallurgical				gold	recovery
92.1%					
Average		diluted		gold	grade
4.5	g/t Au				
PEA	life		of	mine	(LOM)
11	years				
Total		mineralized		material	mined
14,683,000	tonnes				
Contained		gold	in	mined	resource
2,133,000	oz				
Payable				gold	LOM
1,966,000	oz				

All-in sustaining costs net of byproduct credits and royalties
 over LOM \$796 (U.S.)/oz
 Estimated all-in cost (capex plus opex)
 \$912 (U.S.)/oz
 Total unit operating cost
 \$105.13/tonne mined
 Gross revenue
 \$3.39-billion
 Operating cash flow
 \$1.54-billion
 Mine construction commencement
 Mid-2021
 NPV before taxes and mining duties
 \$632.7-million
 IRR before taxes and mining duties
 34.9%

Chris Lodder, president and chief executive officer,
commented: *"Today's PEA results for our Cariboo gold project*
provide a robust after-tax internal rate of return of 28 per
cent and after-tax net present value of \$402-million with a
capex [capital expenditure] of \$306-million, using only about
50 per cent of our present mineral resource estimate. This is
a very strong start to a project that is growing as new
resources are being delineated by our ongoing successful
exploration at depth and on strike of the present resources
and throughout the 2,000-square-kilometre prospective land
package. The PEA envisions mining up to 4,000 tonne per day
utilizing a long-hole mining approach, focused on extracting
large panels with minimum widths of 3.7 metres and minimum
height of 30 metres. A key outcome of our extensive mining and
processing testwork is the ability to produce a high-quality
concentrate averaging 20.5 gold g/t [grams per tonne] at the
mine site and continued use of our upgraded Quesnel River mill
for final processing. This, along with optimization of the
mining method, allows us to include lower-grade resources in

the mine plan. In summary, the PEA outlines a solid base case for significant and profitable gold production with low capital costs in an extensive brownfields district with superb production expansion potential. BGM's vision of building a long-life, high-economic-margin, low-environmental-impact mine in one of Canada's great historic mining camps is now entering the permitting and advanced engineering stage."

The study was prepared by BBA Inc. under the supervision of Osisko Group's project manager, Kim-Quyen Nguyen, PEng, MBA, and the Osisko Group technical team. The study included contributions from the geological and engineering teams at Allnorth Consultants Ltd., BBA, InnovExplo Inc., Golder Associates Ltd., Mining Plus Canada Consulting Ltd., SRK Consulting (Canada) Inc. and WSP Canada Inc.

This preliminary economic assessment foresees a project that would have a significant economic impact and minimal environmental impact for the Cariboo region of British Columbia, with the potential of generating over \$3.39-billion of gross revenue and contributing approximately 320 permanent, well-remunerated jobs during the production phase, as well as an additional 120 during the construction phase.

PEA SUMMARY

Total mineralized material mined (tonnes)	14,683,000
Average diluted gold grade (g/t Au)	4.52
Total gold contained (oz)	2,133,000
Total gold payable (oz)	1,966,000
Gold recovery (including payable) (%)	92.1
Average annual gold produced (gold oz per year)	185,000
Total initial capital cost (\$M)	305.5
Sustaining capital (\$M)	327.4
Closure cost (\$M)	15.1
Unit operating cost (per tonne mined)	
Mining (\$)	65.39

Processing (including paste backfill) (\$)	18.88
Transportation (\$)	5.60
Tailings, waste and water management (\$)	4.18
General and administration (\$)	11.07
Total unit operating costs (per tonne mined) (\$)	105.13

Opportunities to enhance value

Cariboo has very high potential for mineral resource expansion, as the Shaft Cow, Valley and Mosquito deposits are open along strike and down dip, and new zones are still being discovered within the larger highly prospective land package. Much of the sustaining capital is related to underground development, but it also allows access to much of the remaining defined resource not used in the present preliminary economic assessment to allow cost-efficient resource delineation and conversion. Future mine modelling using more selective mining methods represents opportunity to capture additional resources potentially minable in mineralised zones, and metallurgical testwork is planned to optimize the processing.

Trade-off studies will also be performed to determine the best overall economic processing and water management methods. Geotechnical work, combined with an improved mining sequence/development schedule and trade-off studies on material handling, and mine infrastructures will further optimize the design of the project.

Table 3: Summary Economics (at US\$1,325 gold per oz total)

LOM NSR revenue (C\$M)	3,373

Preliminary economic assessment details

The independent preliminary economic assessment was prepared through the collaboration of the following firms: Allnorth Consultants (Vancouver, B.C.); BBA (Vancouver, B.C.); InnovExplo (Val d'Or, Que.); Golder Associates; Mining Plus Canada Consulting (Vancouver, B.C.); SRK Consulting (Vancouver, B.C.); and WSP Canada (Val d'Or, Que.). These firms provided mineral resource estimates, design parameters and cost estimates for mine operations, process facilities, major equipment selection, waste rock and tailings storage, reclamation, permitting, and operating and capital expenditures. The attached table summarizes the contributors and their areas of responsibility.

Table 7: Consulting Firm and Area of Responsibility

Consulting Firm	Area of Responsibility
Allnorth Ltd.	<ul style="list-style-type: none"> - Camp infrastructure design at Mine and QR site; - Storm Water management at QR Mill and Camp sites;
BBA Inc	<ul style="list-style-type: none"> - Geotechnical input for the surface infrastructure; - Metallurgical test work analysis and process design criteria (excludes the paste backfill plant, and QR mill modifications). - IT infrastructure design and costs (Mine site); - Electrical infrastructure design and costs (supply and distribution at Mine site); - Surface tailings and waste rock management facility and water management designs and costs (QR site); - Waste management infrastructure design and costs at Bonanza Ledge and Mine site; - Market studies and contracts; - General and administration, waste and mineralized material operating costs; - Financial Analysis and overall NI 43-10 integration.
InnovExplo Inc	<ul style="list-style-type: none"> - Current and historical geology, exploration, drilling, - Sample preparation and QA/QC, and data verification; - Geological modelling and mineral resource estimate; - Historical data review.
Golder Associates Ltd	<ul style="list-style-type: none"> - Waste rock, tailings, mineralization and water geochemical characterization; - Water treatment plant design, capital and operating costs; - Filtered tailings and related water management design and cost (QR); - Site wide water balance and management plan (Wells and QR sites); - Environmental studies, permitting and closure costs; - Regulatory context, social considerations, and anticipated environmental issues.
Mining Plus Canada Consulting Ltd	<ul style="list-style-type: none"> - Underground mine design, underground infrastructure, ventilation, production scheduling, underground capital costs and operating costs;
SRK Consulting Inc.	<ul style="list-style-type: none"> - Rock mass characterization and rock mechanics input to underground mine design and ground control
WSP Canada Inc.	<ul style="list-style-type: none"> - Hydrogeology input to underground mine design; - Process plant and paste backfill plant design, capital costs and operating costs (Wells and QR); - Rock crushing and handling design and cost; - Emergency electrical infrastructure design and costs; - Crushed rock handling system from underground mine to mine site surface design and costs.

Resource estimate

The preliminary economic assessment is based on an indicated and inferred mineral resource estimate completed by

independent qualified persons Christine Beausoleil (PGeo) and Carl Pelletier (PGeo) of InnovExplo for the Cariboo gold project. This estimate consists of an indicated resource and an inferred resource using a base cut-off of 3.0 grams per tonne gold.

CARIBOO GOLD PROJECT MINERAL				
RESOURCE ESTIMATE				
Deposit	Indicated			
Inferred				
	Tonnes (000s)	Grade (g/t)	Au (000s oz)	
Tonnes (000s)	Grade (g/t)	Au (000s oz)		
Mosquito	542	7.1	124	
690	6.5	144		
Shaft	7,200	5.6	1,300	
5,817	5.0	941		
Valley	1,212	5.3	208	
3,475	4.9	545		
Cow	3,578	5.5	637	
1,867	4.7	282		
Total	12,532	5.6	2,269	
11,849	5.0	1,912		

Mineral resources that are not mineral reserves do not have demonstrated economic viability. For further details, mineral resource estimate notes and resource modelling notes, please see the NI 43-101-compliant resource report titled, "NI 43-101 Technical Report and Mineral Resource Estimate Update for the Cariboo Gold Project, British Columbia, Canada," dated effective May 29, 2019, and filed on SEDAR on July 11, 2019, under the company profile.

Capital and operating cost summaries

CAPITAL COST SUMMARY
(in millions)

Capital				costs
Preproduction	Sustaining	Total

OPERATING COST SUMMARY

Operating costs	\$/t mined
Mining	65.39
Transportation	5.60
Processing (including paste backfill)	18.88
Tailings, waste and water management	4.18
General and administration	11.07
Total	105.13

COSTS PER OUNCE
(US\$/oz)

Capex	249.90
Opex	661.90
All-in cost	911.80

Mining

The Cariboo gold project will consist of the extraction of four separate deposits: Cow, Valley, Shaft and Mosquito. The overall strategy is to simultaneously mine two or three deposits to achieve a total production rate of 4,000 tonnes per day.

The Cariboo gold mine site is located near Wells, B.C., 83 kilometres east of Quesnel, B.C. The underground mine complex is located beneath Island Mountain, Cow Mountain and the valley between the two mountains. The mineral resources used in the mine plan are contained in four deposits (Shaft, Cow, Valley and Mosquito) over a length of 3.7 kilometres and span from surface down to a depth of approximately 640 metres. Each deposit is characterized by multiple vein corridors that trend east-northeast and dip vertically to subvertically (see May 29, 2019, press release for a more detailed description of vein corridors and the controls on gold mineralization). The mining method selected is long hole with longitudinal retreat on panels with sublevels every 30 metres and strike lengths between eight to 20 metres, depending on rock quality, and minimum thicknesses of 3.7 metres. Mineralized material will be extracted by ramp using a fleet of 10-tonne and 14-tonne load-haul dumps (LHDs) and 50-tonne haul trucks at a total mine production rate of 4,000 tonnes per day.

Mineralised material mined underground will feed an underground crushing facility, while the waste rock from development will mostly remain underground and be used as backfill, except for during pre-production, where the development waste rock will be transported to the waste rock storage facilities (WRSF) on a historic mine impacted site on Barkerville Mountain. Cemented and uncemented rock will both be used to backfill excavated stope voids to progress the mining sequence. Cemented paste backfill will be produced with

tailings from the flotation circuit at surface and returned underground to be used in the backfill strategy to fill excavated stopes and old underground workings, where required. All tailings will be returned underground and no tails will be disposed on surface.

Processing

The mineralised material will be crushed underground, transported to surface by a vertical conveyor and stored in a silo at the surface concentrator. The first concentration step will be completed using mineral sorters. The surface silo will feed a screen where coarser particles (greater than 12 millimetres) will be separated, washed and fed to the mineral sorters. Mineral sorter product (sulphide-bearing and gold-bearing material) will be further crushed using a secondary cone crusher, for which the secondary crusher product will feed either the milling and flotation circuit for further concentration or the final mineralised material silo for transport to the QR mill. Mineral sorter waste will be sent to a waste silo for placement in the waste rock storage facilities.

A proportion (limited by the Wells mill design throughput) of the mineral sorter concentrate, as well as particles finer than 12 mm passing through the screens, will feed the flotation concentration circuit. The mineralised material will feed a ball mill closed by a cyclone cluster, where the ball mill product will feed a pyrite flotation circuit. The mineralised material will be further separated into a pyrite flotation concentrate and flotation tailings. Both the flotation concentrate and the flotation tailings will be thickened and filtered. The flotation concentrate will then be combined with a proportion of the mineral sorter product in the final mineralised material bin and stored for transport to the existing QR mill, while the flotation tailings will be

used for producing paste backfill.

At the QR mill, processing will consist of grinding to a P80 of 45 microns, including a gravity circuit and a carbon-in-pulp (CIP) circuit, followed by cyanide destruction, thickening, filtration and tailings disposal. An adsorption-desorption-recovery (ADR) circuit and gold room recover the gold and produce dore bars. The plant includes a reagent preparation area and process water circuit to service the entire plant. The overall payable gold recovery is estimated to average 92.1 per cent over the life of mine.

The pre-concentration plant at the mine site would also include a wet laboratory, mill, mine and maintenance shop. There is an existing laboratory at the QR mill site.

Surface infrastructure and construction indirect

The Cariboo gold project comprises one mine site, one WRSF site and one plant site, including filtered tailings stack. Crushed mineralised material from underground will be conveyed to the surface pre-concentration plant at the mine site. The concentrated material will be transported by trucks to the QR mill site for processing (plant site). A proportion of the waste rock generated by the mine development will be stored at the mine site WRSF.

The Cariboo gold project mine site is located 50 kilometres northeast, or 115 kilometres by road, of the QR mill site; the Bonanza Ledge site is located five kilometres from the mine site.

The Cariboo gold project envisions construction of the following key infrastructure: Cariboo gold mine; pre-

concentration plant at the mine site; onsite control gate and parking area; overhead transmission line from BC Hydro's Barlow substation near Quesnel to the mine site; 69 kVA (kilovolt-ampere) mine site substation fed from the BC Hydro grid; pre-concentration plant; maintenance shop; mine warehouses; Willow River bridge; fire water pump station; mine onsite roads; waste water treatment at mine site; WRSF at mine and Bonanza Ledge sites; mine camp complex (comprising the mine dry, offices, cafeteria, fitness room and dormitory); mine and QR mill sites; water treatment plants at mine and QR mill sites; QR mill filtered tailings stack; and associated water management infrastructure.

Indirect costs, including owner's costs, engineering, procurement and construction management, temporary facilities for construction and other related items are estimated at \$64.4-million. An additional \$30.0-million have been budgeted as contingency.

Environment and reclamation

The Cariboo gold project is subject to both the provincial and federal environmental assessment (EA) processes. The project facilities are within the jurisdictions of the Cariboo regional district and the district of Wells. These jurisdictions have existing bylaws that may pertain to project activities/operations and property ownership or business operations.

Environmental baseline data collection has been initiated for the mine site areas. All the collected baseline data will inform the environmental impact assessment study, which is currently under way. The environmental baseline studies will

also support the continuing permitting process and the future permit applications, once the environmental impact assessment study has been approved and the EA certificates have been received.

In addition to provincial and federal EA approvals, the project will require several permits, approvals and authorizations prior to start-up and throughout all stages of the project. Application for these permits, approvals and authorizations will be initiated following the receipt of the EA certificates. The project must also comply with any other terms and conditions associated with the EA certificates.

A reclamation and closure plan for the mine and QR mill sites has been developed, in accordance with the Mining Act of British Columbia. Sites reclamation costs were estimated at \$15.1-million. The sites reclamation cost estimate for the Cariboo gold project is based on returning the sites to a satisfactory state that mainly includes: eliminating all unacceptable risks to human health and safety; dismantling of the buildings and infrastructure associated with the mine and mining activities; a pre-concentration and processing plant; the reclamation of the filtered tailings stack; and WRSFs. This cost estimate includes the cost of site reclamation as well as post-closure monitoring. In accordance with the regulations, the corporation intends to post a bond as a guarantee for the site closure cost.

Indigenous and stakeholder engagement

Barkerville Gold Mines has taken a pro-active and transparent approach with indigenous and stakeholder engagement, sharing project information, seeking input and involving communities

and individuals in the project on a continuing basis since 2015.

Consultation on the project with indigenous and non-indigenous communities was initiated in 2015 and has continued with frequent engagement and information sharing on project activities, employment and contracting opportunities through meetings and open-house presentations.

Concerns raised by communities include: land disturbance; water quality; impacts to wildlife; and the cumulative effects of all projects in the area. Barkerville Gold Mines is committed to continuing dialogue with potentially affected communities through the environmental assessment process.

Both the indigenous and non-indigenous communities have expressed strong support for the project. Their interest in the project is to maximise the economic benefits for local communities – specifically with a focus on employment and entrepreneurial opportunities throughout the phases of the project.

Royalties

A 4-per-cent net smelter return royalty on all metals produced from the Cariboo gold project has been applied.

Independent qualified persons

This preliminary economic assessment was prepared for Barkerville Gold Mines by BBA and other industry consultants, all qualified persons under NI 43-101. The qualified persons

have reviewed and approved the content of this press release. The independent qualified persons that contributed to the preliminary economic assessment include:

- Grant Morgan (Allnorth Consultants);
- Colin Hardie and Alain Dorval (BBA);
- Evan Jones, Mike Tremblay and Michael Bratty (Golder Associates);
- Christine Beausoleil and Carl Pelletier (InnovExplo);
- Zach Allwright (Mining Plus Canada Consulting);
- Tim Coleman (SRK);
- Mathieu Belisle and Andreanne Hamel (WSP).

About Barkerville Gold Mines Ltd.

Barkerville Gold Mines is focused on developing its extensive mineral rights package, located in the historical Cariboo mining district of central British Columbia. Barkerville Gold Mines' Cariboo gold project mineral tenures cover 1,950 square kilometres, along a strike length of 67 kilometres, which includes several past-producing placer and hard rock mines, making it one of the most well-endowed land packages in British Columbia. Since the management change in mid-2015, the company has unlocked the fundamental structural controls of gold mineralisation.

We seek Safe Harbor.
