No reason is apparent for the sudden fall in the price of ETH fell 12% in a day and 19.4% for the week.

.

Crypto markets are currently bathing in a sea of red after Bitcoin failed to find support in the \$11,000 region and plummeted nearly 10% towards \$10,000. This drop led most major altcoins, including [Ethereum \(ETH\)](#), to reel lower today, with many cryptocurrencies trading down over 10%.

The plunge caused Ethereum to flash-crash to \$191 on Bitstamp, and some analysts believe that ETH will continue dropping lower in the near-future.

At the time of writing, Ethereum is trading down over 11% at \$239, which is down significantly from its daily highs of \$270.

This downwards pressure marks a significant extension of the selling pressure that ETH first incurred in late-June when it rapidly surged to \$350 before incurring a sudden influx of selling pressure that sent it reeling down to roughly \$280.
