

EnviroLeach's new technology validated by Golden Predator Mining

Enviroleach {CSE: ETI}

Golden Predator Mining {TSX.V: GPY} have successfully confirmed that EnviroLeach Technologies' environmentally friendly technology can effectively extract and recover more than 95% of the gold from sulphide concentrates.

Enviroleach {CSE: ETI}

Golden Predator Mining {TSX.V: GPY} have successfully confirmed that EnviroLeach Technologies' environmentally

friendly technology can effectively extract and recover more than 95% of the gold from sulphide concentrates.

The concentrate is produced using Golden Predator's Secondary Recovery Unit (SRU™).

With this technology confirmed in successive tests both in the EnviroLeach facility and at the Golden Predator bulk sample processing plant, the partner companies have initiated a larger material test run to process up to 5 tons of gold-bearing sulphide concentrates, to be completed onsite at Golden Predator's plant in the Yukon.

We will continue to watch this interesting situation as Enviroleach continue forward with their new technology for environmentally recovered precious metals.
