Mr. Nick Weedon reports

**SMARTCOOL BEGIN HALL HUNTER PARTNERSHIP INSTALLATIONS ACROSS
UK SITES**

Smartcool Systems Inc.'s Smartcool UK has successfully secured orders to install for Hall Hunter Partnership in the United Kingdom and is expecting significant energy savings to be delivered.

Hall Hunter Partnership has implemented, and is currently installing, Smartcool's technology as part of its continuing drive to reduce energy consumption and achieve significant energy reductions. Smartcool engineers are currently deploying ESM and EC03 systems, which will see a quick and positive energy reduction across the first two HHP sites. Further sites are planned and are expected to come on-line in the very near future. Most fruit and vegetable crops require refrigeration to slow the ripening process while being transported to market. Smartcool's' proprietary optimization technology reduces the cost of this refrigeration process.

Nick Weedon, national sales agent for Smartcool, commented:
"Hall Hunter Partnership are a significant player in the berry-growing world and deliver exceptional-quality fruit across the U.K. and Western Europe. They also deliver quality and excellence through an approach that combines decades of experience, expertise and passion with modern, innovative techniques. This is achieved through family core values that Smartcool have been pleased to embrace. I look forward to delivering some very significant reductions across the HHP estate."
