

Cabral Gold Drills 30m @ 2.6 g/t Oxidized gold

[Cabral Gold \(TSX.V: CBR\)](#)

Announced assay results from an additional 12 RC holes testing near-surface oxide material at the Machichie Main Zone, Cuiú Cuiú gold district in northern Brazil.

These holes are part of a drill program designed to better define and quantify the saprolite and blanket gold-in-oxide mineralization at the Machichie target, and could have an impact on the current plans for trial-mining oxide material in that area.

Cabral Gold Drills 30m @ 2.6 g/t gold in Oxidized Material

from Surface at Machichie

Vancouver, British Columbia – February 6, 2024 – **Cabral Gold Inc.** (“Cabral” or the “Company”) (TSXV: CBR) (OTC: CBGZF) is pleased to announce assay results from an additional 12 RC holes testing near-surface oxide material at the Machichie Main Zone, Cuiú Cuiú gold district in northern Brazil.

These holes are part of a drill program designed to better define and quantify the saprolite and blanket gold-in-oxide mineralization at the Machichie target, which is located just

500m northwest of the MG gold deposit and could have an impact on the current plans for trial-mining oxide material in that area.

Highlights

- RC409 returned 30m @ 2.6 g/t gold from surface in mineralized basement saprolite material including 12m @ 5.6 g/t gold from 11m depth
- RC418 returned 9m @ 4.3 g/t gold in mineralized fresh rock from 41m depth including 2m @ 18.6 g/t gold at the start of the 9m interval
- RC414 returned 13m @ 1.6 g/t gold from surface in mineralized saprolite, including 6m @ 2.8 g/t gold from 4m depth
- Other significant new mineralized saprolite drill intercepts include 7m @ 2.7 g/t gold from 7m depth in hole RC411, 15m @ 0.6 g/t gold from surface in hole RC412 and 18m @ 0.6 g/t gold from surface in hole RC413

Alan Carter, Cabral's President and CEO commented,

"These additional RC drill results from Machichie confirm the presence of a significant zone of near surface gold-in-oxide mineralization at Machichie which appears to overlay another primary gold deposit."

“Further drilling will be required to fully define the limits to both the weathered gold-in-oxide mineralized material and the underlying hard-rock mineralized zone which was the focus of previous drilling.

“Both of these zones remain open along strike and to depth. The proximity of Machichie to the MG gold deposit has significant positive implications for the overall near surface gold-in-oxide resources which are amenable to heap leaching at Cuiú Cuiú, as well as the underlying resource base in fresh intrusive basement rocks.”

Cabral Gold Drills 10m @ 10.5 g/t Gold Including 1m @ 63.6 g/t Gold at the Central Gold Deposit, Cuiú Cuiú Gold

District, Brazil

Vancouver, British Columbia—(Newsfile Corp. – January 11, 2024) – **Cabral Gold Inc. (TSXV: CBR) (OTC Pink: CBGZF)** (“Cabral” or the “Company”) is pleased to announce drill results from a further eight RC holes from the Central gold deposit located within the Cuiú Cuiú gold district in northern Brazil.

Highlights

- RC368 returned **10m @ 10.5 g/t gold** from 67m in fresh rock, including **1m @ 63.6 g/t gold** and **1m @ 28.3 g/t gold**. The hole ended in mineralized material grading 1 g/t gold.
- RC384 returned **23m @ 0.9 g/t gold** from 4m in saprolite.
- RC385 returned **13m @ 0.7 g/t gold** from 3m depth, **6m @ 1.4 g/t gold** from 44m depth and **4m @ 2.7 g/t gold** from 59m. All three holes are in saprolite.
- Drill results are pending on 13 RC holes from the Central deposit, and nine shallow power-auger holes testing the MG deposit and 21 RC holes from the Machichie target.

Alan Carter, Cabral's President and CEO, commented,

"The recent results from Central and in particular hole RC368 continue to confirm the presence of near-surface high-grade material.

"The bonanza mineralized zone intersected in hole RC368 is the same zone cut in DDH306 which previously returned 20.9m @ 4.2 g/t gold in saprolite, and should have a positive impact on the near surface resource base in this part of the Central deposit."

Cabral Gold New Year message from the CEO

Cabral Gold (TSX.V: CBR) Following on from a successful drill program in 2023, Dr. Alan Carter, CEO of Cabral has shared his thoughts for the Cuiu Cuiu project going forwards.

Cabral are looking to produce cashflow within a year, with a small scale startup operation, to avoid further share dilution to the stock.

This can then fund further exploration in a prolific gold belt, which compares very favourably with the TZ gold mine being constructed by G Mining around 20 miles away.

I like this method of growing a small company, rather than taking the easy route of simply issuing more shares like confetti.

Of course CEO Alan Carter has a very large personal stake in the company, bought at market prices, so is very aligned with shareholders, which is another thing I like about this company. In my opinion it's important for management to have a meaningful holding in a company, bought at market prices rather than gifted via options.

Dr. Alan Carter's New Year message is reproduced below.

Dear Valued Shareholders,

Now that the dust has settled and we have welcomed in the New Year, I would like to take a moment to reflect on our progress with advancing our Cuiú Cuiú project in Brazil, and also share some thoughts on what lies ahead.

Our Company is in the process of undergoing a significant transition, from a successful junior gold exploration Company to a junior gold producer.

Until recently, and despite making several new discoveries and releasing a string of excellent drill results, our share price, along with most of our peers, has failed to significantly appreciate due to weak market conditions.

As a result, we have elected to transition away from dependence on the model of raising capital by issuing shares and diluting the capital structure, and we are pursuing a clear path aimed at generating revenue by becoming a gold producer with potential free cash flow as early as 2025.

Fortunately, our Cuiú Cuiú project has an enormous footprint (having been the largest placer gold camp in the Tapajos during the 1980's gold rush) and because of the tropical weathering environment, our gold deposits are weathered down to a maximum depth of 60m.

This means that the top 60m is essentially soft red mud or saprolite, and the trial mining and processing of this

saprolite material is currently the subject of the ongoing Pre-Feasibility Study (PFS).

We expect to complete the PFS during the second quarter of this year and if it is positive, it will form the basis of a construction decision at Cuiú Cuiú. As part of the PFS we have been conducting additional drilling aimed at improving our understanding of the higher-grade zones within the saprolite.

We are also conducting additional metallurgical and geotechnical studies and have beefed up our Board and established an independent Technical Committee.

The Tapajos region in Brazil is changing, and it is changing quickly.

As one of the two geologists who originally identified and acquired the TZ project and recognised its potential, it is gratifying for me personally to see that project under construction. TZ should enter production during Q3 2024 and will be Brazil's third largest gold mine.

Given my history and experience with TZ, I should have a better idea than most regarding the potential of our adjacent Cuiú Cuiú project.

I believe that Cuiú Cuiú will eventually become a much larger gold deposit than TZ. Some of the reasons for this are as

follows;

- According to the Agencia Nacional de Mineracao (ANM) in Brazil, Cuiú Cuiú produced 2Moz of placer gold during the Tapajos gold rush which is 10x more than TZ
- The gold-in soil anomaly that we identified at TZ was approximately 1km long. There are numerous gold-in-soil anomalies at Cuiú Cuiú which cover a much larger area
- We have so far identified 4 gold deposits at Cuiú Cuiú (2 with 43-101 compliant resources and 2 (PDM and Machichie) which do not yet have any resources. In addition, we currently have over 40 targets (with gold assays) at Cuiú Cuiú. Compare this with TZ which is a single deposit with 2 or 3 peripheral targets
- The best drill intercept reported outside the TZ deposit returned 20m @ 1.7 g/t gold which is equivalent to 34 gramme metres. At Cuiú Cuiú we have drill intercepts outside the four known deposits that include 27m @ 6.9 g/t gold or 186.3 gramme metres (at Central SE) and 39m @ 5.1 g/t gold or 198.9 gramme metres (at J Cima) to name just two examples

Despite very difficult market conditions during 2023 we were able to raise capital and partner with Osisko Gold Royalties. The deal with Osisko will allow us to complete the PFS and we believe speaks to the quality and potential of the Cuiú Cuiú project.

The year ahead should prove to be transformative for our Company. Numerous drill results are pending from the drill program conducted during late 2023 and additional metallurgical studies are in progress.

The focus will be on completing the ongoing PFS and, if positive, on making a construction decision as soon as

possible thereafter.

On behalf of the entire Cabral Gold team, I would like to express deep appreciation to our investors, partners, and stakeholders for your continued support and we sincerely wish you all a happy, healthy, and prosperous 2024.

Initiating Coverage of South Star Battery Metals

South Star Battery Metals (TSX.V: STS)

We are initiating coverage of STS as they prepare to bring online their graphite pilot plant in Bahia State in northern Brazil.

This is phase 1 of a three stage plan to raise production of graphite in Brazil from 5,000 tpa to 50,000 tpa. STS also have a former producing mine project in Alabama, USA

South Star Santa Cruz mine overhead view

South Star Battery Metals	TSX.V: STS
Stage	Production, development
Metals	Graphite
Market cap	C\$31m @ 73c
Location	Brazil, USA

Comment

This looks like an interesting company, and has a lot I like,

such as financed to production due to start this month, in a tier 1 jurisdiction, with a product, graphite, that is high in demand as a source of supply outside China.

Management are highly experienced, and hold 11% of the company, with Sprott involved in a stream lending facility adding another warm feeling.

This is rounded off with a tight share structure, and low market cap.

I am adding to our tier 2 watchlist as small scale production is imminent.

Initiating Coverage of South Star Battery Metals

South Star Battery Metals (TSX.V: STS) We are initiating coverage of STS as they prepare to bring online their graphite pilot plant in Bahia State in northern Brazil.

This is phase 1 of a three stage plan to raise production of graphite in Brazil from 5,000 tpa to 50,000 tpa over a 4 year period.

STS are fully funded to phase 1 production.

STS also have a former producing mine project in Alabama, USA

Company Highlights

Safe sourced graphite production in the Americas with commercial production scheduled at Santa Cruz Phase 1 for Q4/2023, Phase 2 planned in 2026, and Phase 3 planned in 2028

- Fully integrated vertical production planned at BamaStar including battery anode material in southeast corridor of U.S. scheduled for 2027
 - Management team with proven track-record of taking projects from concept, through development, into production & operations in the Americas
 - Diversified, scalable, global portfolio of graphite mines in stable, Tier 1 jurisdictions to minimize production risks
 - Santa Cruz in Bahia, Brazil
 - BamaStar Graphite in Alabama, US
 - Phased, modular design & construction to facilitate assemblies, guarantee quality and shorten schedules
 - Strong Financial Partners
 - *Partnered with Sprott Resources Streaming & Royalty Corp on Santa Cruz with up to US\$28M in stream financing.*
- Phase 1 fully financed and Phase 2 partially financed
- Awarded DoD DPA Title III US\$3.2M grant for BamaStar FS
 - **Fully funded to production for 13,000 tpa at Santa Cruz Phase 1 plant**

Cabral Gold Announces Cuiu Cuiu PFS Update

[Cabral Gold \(TSX.V: CBR\)](#)

Issued an update on the PFS at Cuiu Cuiu, Tapajos State, Brazil.

The current RC drill program is a significant part of this effort and is aimed at identifying additional higher-grade mineralization. We have completed 69 RC holes to date as part of this program and results are currently pending on 55 holes.

Cabral Gold	TSX.V : CBR
Stage	Exploration
Metals	Gold
Market cap	C\$25 m @ 13.5c
Location	Cuiú Cuiú , Tapajos, Para State, Brazil

[*Cabral Gold Provides Update on Prefeasibility Study Regarding Exploitation of Near-Surface Gold-in-Oxide Mineralization at Cuiú Cuiú Gold Project, Brazil*](#)

Alan Carter, CEO of Cabral Gold made the following comments on the news update,

We have an update out today on progress regarding our PFS on the near-surface gold-in-oxide mineralization at our Cuiu Cuiu project in Brazil. This is an exciting time for our company as we advance the PFS on the viability of mining the near surface gold-in-oxide material and heap leach processing of that material. *If the PFS is positive, it should allow for a construction decision during mid-2024.*

Here are Alan's thoughts.

Principle takeaways:

1. We are making good progress with the PFS. The current

RC drill program is a significant part of this effort and is aimed at identifying additional higher-grade mineralization. We have completed 69 RC holes to date as part of this program and results are currently pending on 55 holes, so expect more drill results in the near future

2. This drilling program has returned some excellent higher-grade results to date. These will be incorporated in a revised resource estimate of the oxide material, which in turn will be incorporated into the mine plan. These positive drill results may result in additional higher-grade material which needs to be assessed for gold recoveries

3. As a result, additional column leach metallurgical tests are planned as we consider optimizing throughput rates, pad heights etc. for the heap leach operation. This additional metallurgical work will require a little more time and the PFS is now likely to be completed during the second quarter of 2024

4. A second drill rig has arrived on site and is drilling. This second rig is in the process of completing a geotechnical program aimed at understanding the overall ground conditions prior to the erection of the heap leach pads, the agglomeration and ADR plants, and associated infrastructure. The rig has also been tasked with collecting additional samples for the metallurgical work

5. OK – so what does this all mean?

- Well, it means that the drill results received thus far have been very positive and are leading to a bit of a rethink on several issues including throughput rates – this means the PFS continues to evolve and is generating opportunities to optimize the value of the project which will take a bit more time
- We will not have definitive answers on the economic viability of mining and processing the near surface

oxide material until Q2 2024 but there will be a lot of news between now and then – obviously if the PFS study is positive, it will be a very significant step forward

- As a reminder, the trial mining and heap leach operation is a stepping stone aimed at providing the Company with sufficient capital to drill 1/. The gaps in the existing resources at the MG and Central gold deposits, 2/. Calculate maiden resources for the PDM and Machichie deposits and 3/. Determine how many of the +45 targets are additional gold deposits .

TriStar Gold Corporate Update

January 11, 2023

Scottsdale, Az-(Newsfile Corp. – January 11, 2023) – **TriStar Gold Inc. (TSXV: TSG) (OTCQX: TSGZF)** (the Company or TriStar) is pleased to provide an update on advancements in the work at Castelo de Sonhos gold project in Pará State, Brazil.

TriStar is 100% focused on attaining the Licença Previa (LP), or Preliminary Licence, the main environmental licence in the 3-step Brazilian mine permitting process. TriStar's Environmental Impact Assessment (EIA) and LP application were submitted in July of 2022, and assuming current timeline estimations are correct, we anticipate approval in the third quarter of 2023.

Mr. Nick Appleyard, CEO, TriStar Gold stated;

“The TriStar team are doing an outstanding job in maintaining open and transparent communication channels with the relevant state of Pará authorities.”

Government Relations and Environmental Permitting

With the inauguration of the new administration in Brazil, the TriStar team met with the regulators at the Environmental Secretariat (SEMAS) of Pará State in Belem to confirm the status and timelines for receipt of the LP.

The SEMAS licensing team informed us that the Castelo de Sonhos project is at the head of the line for EIA review. They remain committed to a technical site visit in March 2023, which is the next major milestone event, to review our environmental management and social engagement practices, and confirm the findings of the EIA.

SEMAS has informed TriStar that they anticipate an in-person public hearing in the village of Castelo de Sonhos, with the availability of virtual participation from municipal and other stakeholders. The TriStar team continues to prepare all engagement-related activities and prepare all technical requirements to ensure a successful hearing.

In anticipation of likely requirements for the next stage of permitting, TriStar has already advanced work on cave relevance studies and will be initiating detailed archeological studies.

**Cabral Gold Drills 13.0m @
4.6 g/t Gold Including 1.0m @
49.2 g/t Gold within Gold-in-
Oxide Blanket at the PDM
Target, Cuiú Cuiú District**

21st July 2022

Vancouver, British Columbia—(Newsfile Corp. – July 21, 2022) –**Cabral Gold Inc. (TSXV: CBR) (OTC PINK: CBGZF) (“Cabral” or the “Company”)** is pleased to provide assay results from nine additional RC holes drilled to test the recently identified gold-in-oxide blanket at the PDM target within the Cuiú Cuiú Gold District, northern Brazil.

Highlights are as follows:

- RC310 returned the following mineralized intervals:
 - **13.0m @ 0.3 g/t gold** from surface in oxidized and weathered material
 - **13.0m @ 4.6 g/t gold** from 25.0m in oxide material, **including 1.0m @ 49.2 g/t gold** from 34.0m
- RC313 returned **17.0m @ 1.1 g/t gold** from surface in oxidized and weathered material
- Other significant drill results from oxidized and weathered material at PDM include;
 - RC309: **33.0m @ 0.4 g/t gold** from surface including **10.0m @ 0.8 g/t gold** from 23.0m
 - RC308: **27.0m @ 0.4 g/t gold** from surface
 - RC307: **15.0m @ 0.4 g/t gold** from surface
 - RC311: **11.0m @ 0.4 g/t gold** from surface
 - RC314: **15.0m @ 0.4 g/t gold** from surface

Cabral Gold Management comments

“These latest RC results from the PDM target further demonstrate the presence of a higher-grade core within the unconsolidated oxide blanket, but perhaps more importantly they indicate the possible presence of a second primary mineralized zone in the underlying basement granitic rocks.”

“This may be sub-parallel to the zone of primary gold mineralization previously identified below the oxide blanket, and announced just a few months ago.

“These results lend further credence to the notion that PDM, like Machichie, is a significant new discovery which will require further drilling.”

Alan Carter, Cabral Gold President and CEO

PDM RC Drill Results

The PDM (Pau de Merenda) target is located 2.5km NW of the Central gold deposit at Cuiú Cuiú (Figure 1) within a prominent northwest-trending gold-in-soil anomaly and coincident magnetic low, which have been traced for over 5km along strike. Within this anomaly, referred to as the Central Trend, occur the Central gold deposit, Central SE target, Central North target, Mutum target and PDM target.

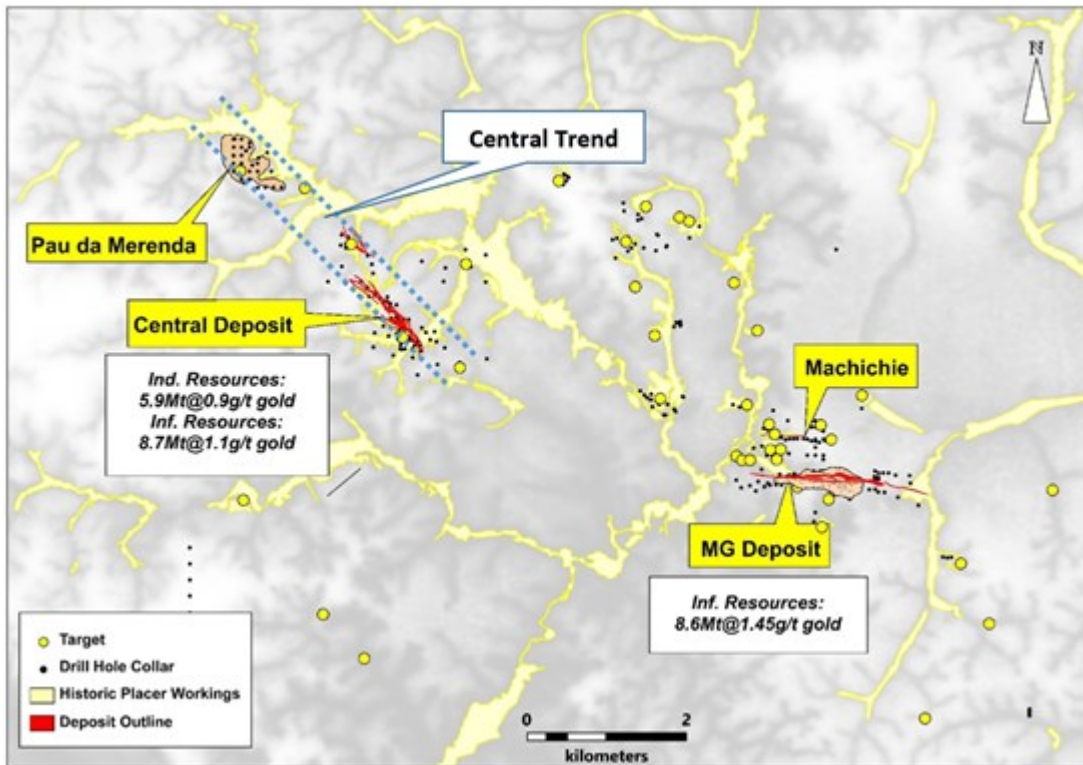

Figure 1: Map showing the location of the Central and MG gold deposits, the PDM (Pau de Merenda) and Machichie gold targets, and other key gold targets (yellow circles) within the the Cuiú Cuiú district

To view an enhanced version of Figure 1, please visit [here](#)

The gold-in-oxide blanket at PDM was initially identified in August 2021 (see press release dated August 10, 2021), and a program of diamond drilling which was initiated in late 2021 subsequently identified an underlying zone of primary gold mineralization in the unweathered granitic basement rocks similar to that at MG and Central.

Results from the initial diamond-drill holes in unweathered granitic basement rocks beneath the gold-in-oxide blanket at PDM included **22.4m @ 4.8 g/t**, including **1.35m @ 62.0 g/t gold** in DDH238; **11.9m @ 3.3 g/t gold** including **0.5m @ 16.1 g/t gold** and **1.2m @ 16.0 g/t gold** in DDH239; and **18.0m @ 2.5 g/t gold** from 92.0m, including **3.0m @ 10.5 g/t gold** in DDH275.

These diamond-drill results define a northwest-trending zone of primary gold mineralization in the granitic rocks directly

underlying the PDM oxide blanket.

The current RC drilling program at PDM has been designed to further define the limits of a higher-grade core within the overlying gold-in-oxide blanket, and has confirmed the presence of this higher-grade core area.

Other significant drill results within the gold-in-oxide blanket at PDM include;

- RC309:**33.0m @ 0.4 g/t gold**from surface, including**10.0m @ 0.8 g/t gold**from 23.0m
 - RC308:**27.0m @ 0.4 g/t gold**from surface
 - RC307:**15.0m @ 0.4 g/t gold**from surface
 - RC311:**11.0m @ 0.4 g/t gold**from surface
 - RC314:**15.0m @ 0.4 g/t gold**from surface

Drilling and Trenching Update

Results are pending on 12 diamond-drill holes at MG.

Results for 30 RC holes are also pending at PDM.

Results are pending on 14 follow-up diamond-drill holes at Machichie and 12 trenches totaling 443m.

Results are pending on 6 diamond-drill holes at the Indio target and additional drilling is planned.

About Cabral Gold Inc.

The Company is a junior resource company engaged in the identification, exploration and development of mineral properties, with a primary focus on gold properties located in Brazil.

The Company has a 100% interest in the Cuiú Cuiú gold district located in the Tapajós Region, within the state of Pará in northern Brazil. Two gold deposits have so far been defined at Cuiú Cuiú and contain 43-101 compliant Indicated resources of 5.9Mt @ 0.90 g/t (200,000 oz) and Inferred resources of 19.5Mt @ 1.24 g/t (800,000 oz).

The Tapajós Gold Province is the site of the largest gold rush in Brazil's history producing an estimated 30 to 50 million ounces of placer gold between 1978 and 1995.

Cuiú Cuiú was the largest area of placer workings in the Tapajós and produced an estimated 2Moz of placer gold historically.

Cabral Gold Drills 9.6m @ 16.4 g/t Gold at Cuiú Cuiú

[Cabral Gold](#) (TSX.V: CBR)

Provided assay results from three diamond-drill holes on two sections in the southern part of the primary Central gold deposit within the Cuiú Cuiú Gold District, Para State, northern Brazil.

Hole DDH268 tested the emerging high-grade zone at Central on section N20870 and returned **9.6m @ 16.4 g/t gold** from 164.3m [...]

Cabral Gold – MG Deposit, Para state, Brazil

Cabral Gold Drills 9.6m @ 16.4 g/t Gold and Defines a High-grade Corridor at Central Gold Deposit, Cuiú Cuiú Gold District

3rd May 2022

Vancouver, British Columbia—(Newsfile Corp. – May 3, 2022) – **Cabral Gold Inc. (TSXV: CBR) (OTC Pink: CBGZF) (“Cabral” or**

the “Company”) is pleased to provide assay results from three diamond-drill holes on two sections in the southern part of the primary Central gold deposit within the Cuiú Cuiú Gold District, northern Brazil.

Highlights are as follows:

- **DDH268** tested the emerging high-grade zone at Central on section N20870 and returned the following mineralized intervals:
 - **9.6m @ 16.4 g/t gold** from 164.3m **including 1.2m @ 112.0 g/t gold** from 166.9m and **2.1m @ 11.5 g/t gold** from 170.2m. This high-grade intercept occurs within fresh (unweathered), highly brecciated and altered basement intrusive rocks
 - **17.5m @ 0.5 g/t gold** from 76.4m, and **30.4m @ 1.1 g/t gold** from 130.0m. These intercepts also occur within fresh, strongly brecciated and highly altered basement intrusive rocks
- **DDH267** was drilled on section N20845 to test both the high-grade zone and the down-dip continuity of the deposit at Central. It returned the following mineralized intervals:
 - **12.8m @ 1.0 g/t gold** from 82.6m including **0.9m @ 8.1 g/t gold** from 94.5m
 - **17.5m @ 1.9 g/t gold** from 149.5m, including **3.2m @ 5.3 g/t gold** from 156.0m, and **1.3m @ 5.9 g/t gold** from 162.5m
 - **5.5m @ 2.1 g/t gold** from 189.0m including **1.0m @ 6.6 g/t gold** from 191.0m
- **DDH281** was also drilled on section N20870 to define the northeastern limit of the mineralized zone at Central. It returned **11.3m @ 0.7 g/t gold** from surface in the overlying gold-in-oxide blanket. The blanket remains

open to the northeast, and to the southwest on this section

- Drilling suggests there is a distinct northwest-trending, steeply dipping, high-grade corridor that contains multiple individual high-grade zones. The corridor follows the southwestern margin of the Central deposit in this area. It has now been traced for over 100m along strike, appears to be over 25m wide, and remains open at depth below 350m

Cabral Gold management comments

“These latest very high-grade drill results from Central lend further support to recent evidence from drilling that a high-grade corridor of mineralization exists within the core of the primary basement Central gold deposit.

“This high-grade zone has now been traced along strike for at least 100m and remains open to the northwest and southeast. Furthermore, it has been encountered in one of the deepest historic holes on the project, at 350m below surface.

“The high-grade zone is open down-dip on all of the sections in the corridor. We look forward to the results of the ongoing drill program at Central, as well as further results from the four other drill rigs which are currently active at the nearby MG, Machichie, PDM and Indio targets.”

Alan Carter, Cabral Gold President and CEO

Cabral Gold

Cabral Gold Trenching Program Extends Machichie 285m to West and returns 5m @ 8.3 g/t gold, Cuiú Cuiú Gold District, Brazil

Vancouver, British Columbia – February 2, 2022 – Cabral Gold Inc. (“Cabral” or the “Company”) (TSXV: CBR) (OTC: CBGZF) is pleased to provide assay results from several trenches recently excavated immediately west of the main Machichie target within the Cuiú Cuiú gold district in northern Brazil.

Highlights are as follows:

- Trench CT35A, located 285m west of the most westerly drill hole at the main E-W trending Machichie main zone, returned
 - 5m @ 8.3 g/t gold
 - including 1m @ 37.8 g/t gold
- The mineralization in CT35A is on strike and interpreted to represent the western extension of the E-W trending main Machichie mineralized structure. If proven correct, this would represent a 60% extension to the known mineralized zone at Machichie. This suggests that the Machichie main zone could extend for at least 800m along strike, whilst still being open to the west
- Trench CT36 completed 100m to the NE of CT35A also returned encouraging results in a new parallel structure at Machichie, including:
 - 0.6m @ 12.9 g/t gold,
 - 1.5m @ 1.6 g/t gold, and
 - 0.7 @ 1.1 g/t gold
- Further trenching in both areas is in progress in advance of planned follow-up drilling

Cabral Gold management comments

“The results from recent trenching west of the main E-W trending Machichie mineralized zone suggest there could be a significant extension to the zone as we currently know it, indicating a possible 60% addition to the strike length of the known mineralized structure.

“Whilst further trenching is ongoing and drilling is planned, this is a major development in our efforts to determine the size and scope of the mineralized zones at Machichie, which is located just 500m north of the MG gold deposit.

“It also adds further support to previous drilling which identified numerous near-surface high-grade vein structures in this area of the Cuiú Cuiú property.

“With the existing two gold deposits at MG and Central, the recent discovery of three near-surface gold in oxide blankets, and a new hard-rock mineralized zone at the PDM target, Cuiú Cuiú is rapidly emerging as a significant gold district, containing multiple zones of near-surface gold mineralization, which are all located in close proximity.”

Alan Carter, Cabral Gold President and CEO.

Machichie Trench Results

The Machichie target is located 500m north of the MG gold deposit (Figure 1). It was initially discovered in 2019. Previous drilling at Machichie identified a persistent mineralized zone which is E-W trending, dips steeply to the north. The main zone consists of a high-grade core zone surrounded by a low-grade alteration envelope. This is very similar to the style of primary bedrock gold deposits at MG and Central, as well as the recently announced PDM basement discovery (see press releases dated December 15, 2021 and January 12, 2022).

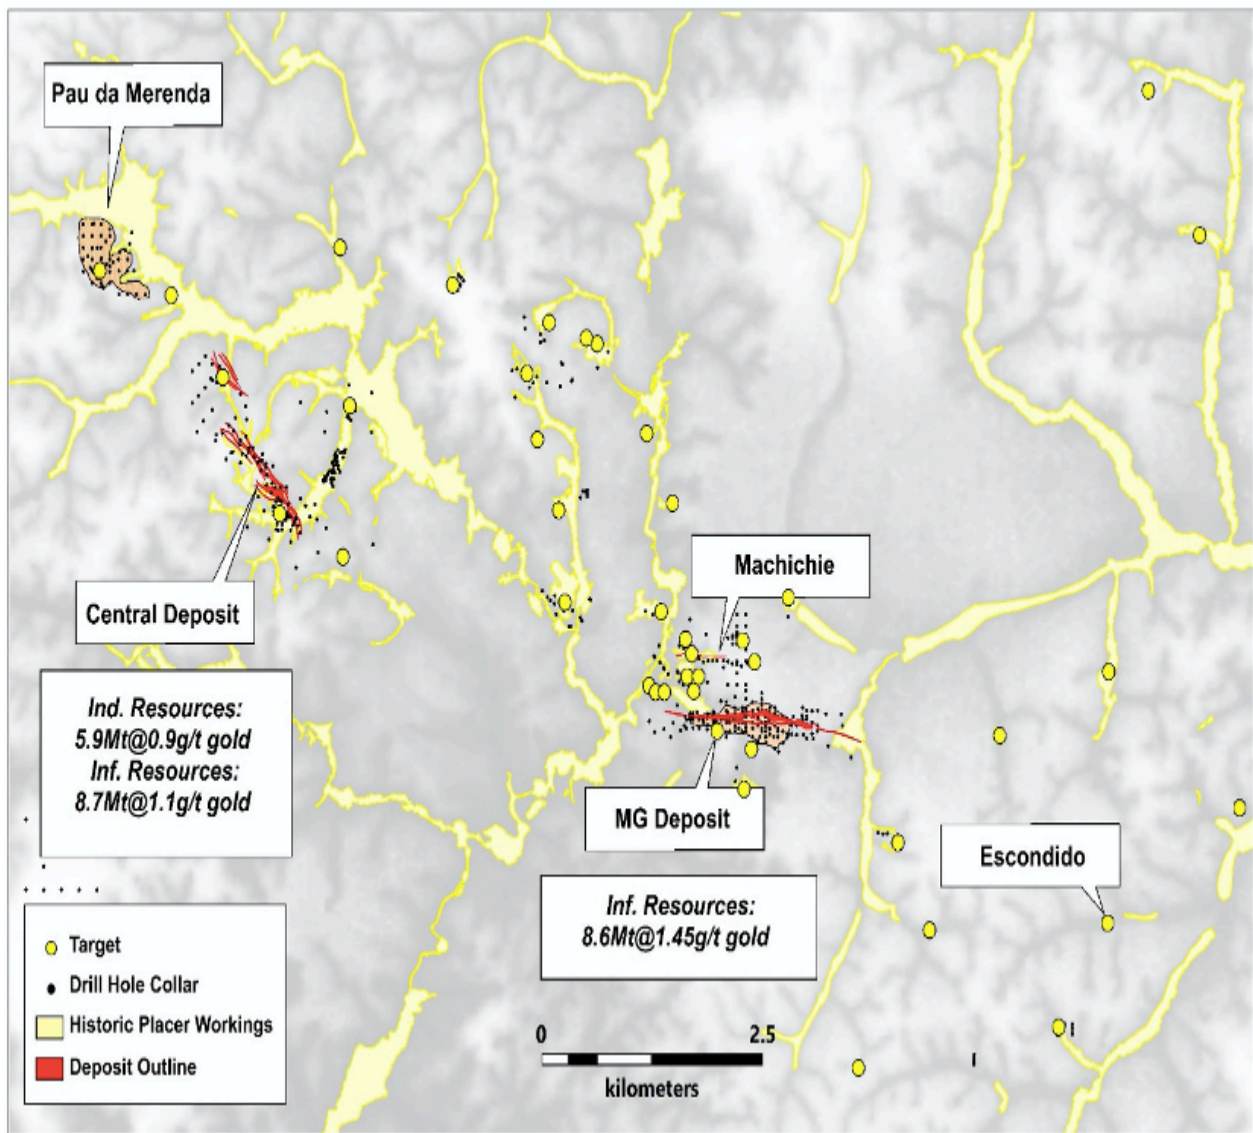

Figure 1: Map showing the location of the Machichie target and the existing MG and Central gold primary gold deposits, as well as the recently identified gold-in-oxide blanket and underlying mineralized zone in hard rock at the PDM target within the Cuiú Cuiú district. Other key targets are shown as yellow circles.

Cabral Gold Drills 55.1m @ 1.1 g/t gold including 5m @ 6.1 g/t gold, and Identifies a Third Gold-in-Oxide Blanket within Cuiú Cuiú Gold District

Vancouver, British Columbia – January 27, 2022 – **Cabral Gold Inc.** (“Cabral” or the “Company”) (**TSX.V: CBR**) (OTC: CBGZF) is pleased to provide assay results from an initial 12 RC drill holes and three diamond holes drilled within and above the Central gold deposit within the Cuiú Cuiú gold district in northern Brazil.

Highlights are as follows:

- DDH251, intersected gold-in-oxide mineralization at the Central deposit, and returned
- 55.1m @ 1.1 g/t gold from 4.9m depth
- including 5m @ 6.1 g/t gold
- and 15.5m @ 1.7 g/t gold from 65.8m depth
- and 3.5m @ 0.8 g/t gold from 81.3m depth in un-weathered and highly brecciate and altered intrusive rocks beneath the oxidation

- DDH247, also drilled at Central, returned 11.0m @ 0.7 g/t gold from surface, in gold-in-oxide blanket material, as well as 20.4m @ 0.5 g/t gold and 23.3m @ 0.3 g/t gold in un-weathered and highly brecciate and altered intrusive rocks further down the hole
- Results on an initial 10 shallow RC holes drilled within and around the northern part of the Central deposit, revealed a thin but consistent gold-in-oxide blanket. Results of note include RC259 which returned 26m @ 0.4 g/t gold in oxidized material from surface

Cabral Gold Management comments

“The results from the initial drilling at the Central gold deposit clearly demonstrate that we have a significant zone of gold-in-oxide mineralization forming a blanket above the primary Central deposit.

“This is the third gold-in-oxide blanket identified at Cuiú Cuiú since the initial discovery at MG in April of last year, and these recent discoveries are in addition to the two existing hard-rock deposits with resources at Cuiú Cuiú.

“At this stage, we do not know the extent of the blanket or how much of this material at Central is in-situ weathered primary gold mineralization, and how much is transported cover material.

“Nevertheless, both types of material are expected to add significantly to the inventory of potentially leachable gold-in-oxide deposits recently identified at MG and PDM.

“Additional drilling over the next months is expected to further define the limits of the oxide material at Central, whilst providing further definition of the high-grade zones within the underlying primary deposit at Central.”

Alan Carter, Cabral Gold President and CEO

Cabral Gold Reviews 2021 Achievements and Outlines Plans for 2022 at Cuiú Cuiú Gold District, Brazil

6th January 2022

Vancouver, British Columbia—(Newsfile Corp. – January 6, 2022) –**Cabral Gold Inc. (TSXV: CBR) (OTC: CBGZF) (“Cabral” or the “Company”)** is pleased to provide a summary of successes achieved during 2021 at the Cuiú Cuiú gold district in northern Brazil, and outline its plans for 2022.

During 2021, Cabral’s ongoing drill program was primarily focused on defining the high-grade zones within the MG and Central gold deposits, but the Company also identified two new near surface gold-in-oxide blankets at MG and PDM, as well as

a new high-grade mineralized zone in hard rock at PDM. The Company continued to drill test and expand other new target areas, such as Machichie, Machichie SW, Morro da Lua, and Indio. There are still some 39 other gold targets to test on the 36,000 ha Cuiú Cuiú property. Concurrent with the drill program Cabral continued its regional grassroots reconnaissance exploration in new areas of the district including stream- and soil-geochemical sampling and prospecting.

Based on positive initial results realized during early 2021, Cabral accelerated its drilling campaign. The Company started 2021 with two RC rigs and added a diamond rig in February and two more diamond rigs in July following the successful closing of a financing in July. A total of 25,359m of drilling was completed during the year, including 16,027m of RC drilling and 9,332m of diamond drilling. Assay results from 21 diamond-drill holes and 12 RC holes completed at MG, PDM, and Central were still pending at year end and will be released in the coming weeks.

Cabral is looking forward to continuing its aggressive exploration program in 2022 and is planning an expanded drill program at PDM following encouraging drill results in December which included 22.4m @ 4.8 g/t gold from the granitic rocks below the recently identified gold-in-oxide blanket. In addition, diamond drilling at the Central and MG gold deposits will continue with the objective of defining higher grade zones within both deposits, while testing for additional zones of mineralization. RC drilling will also continue testing the overburden above the Central gold deposit with the objective of identifying a third gold-in-oxide blanket.

Elsewhere additional drilling and trenching is planned at Machichie, and several regional targets including Tracaja, Indio, Dona Moca and the new Escondido target.

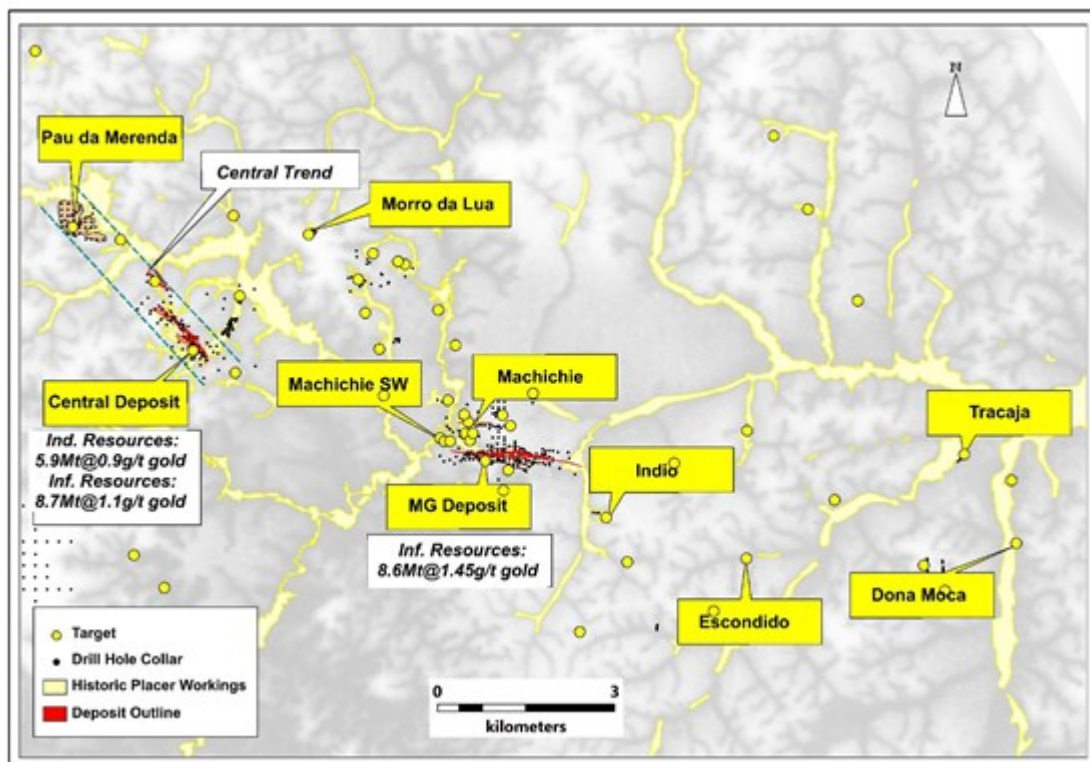

Figure 1: Topographic map showing the location of the MG and Central gold deposits (in red) and the outline of the recently discovered gold-in-oxide blankets at PDM and MG (in beige) as well as other key targets at Cuiú Cuiú. The outline of the historic placer gold workings are shown in pale yellow. MG and Central are the two deposits comprising the current project resource

**Cabral Gold Drills 70.8m @
1.0 g/t Gold at MG Gold-in-
Oxide Blanket and Identifies
New Gold Anomaly North of**

Alonso at Cuiú Cuiú Gold District, Brazil

Vancouver, British Columbia—(Newsfile Corp. – December 9, 2021) – **Cabral Gold Inc. (TSXV: CBR) (OTC: CBGZF)** (“**Cabral**” or the “**Company**”) is pleased to provide assay results from five diamond-drill holes completed at the MG gold-in-oxide blanket, and also results from reconnaissance drilling at the Alonso target within the Cuiú Cuiú gold district in northern Brazil.

Highlights are as follows:

- Reconnaissance stream-sediment sampling has identified a new gold anomaly in streams 750m NE of the Alonso target and 3.4km ESE of the MG gold deposit
- The new anomaly has been named Escondido and is very similar to the geochemical and magnetic anomaly which define the MG gold deposit. Five recently completed reconnaissance drill holes at the Alonso target did not intercept any significant gold values of interest, suggesting that the primary source of the boulders is farther afield than previously anticipated, possibly the Escondido area
- Diamond-drill hole MET04 drilled for metallurgical testing at the gold-in-oxide blanket at MG returned **70.8m @ 1.0 g/t gold** from surface, including **17.0m @ 3.3 g/t gold** from 41.0m depth. Similarly, diamond-drill hole MET05 returned **43.6m @ 1.4g/t gold** from surface
- Diamond-drill hole MET03 also completed at the gold-in-oxide blanket at MG returned **54.0m @ 0.7 g/t gold** from

surface, including **21.8m @ 1.4 g/t gold**, and diamond-drill hole MET02 returned **13m @ 0.9 g/t gold** from surface and **21.7m @ 0.8 g/t gold** from 32.2m depth

Cabral Gold management comments

“We are extremely pleased with the assay results received on the five metallurgical test diamond drill holes recently completed at the MG gold-in-oxide blanket and look forward to receiving the results of the metallurgical test work during the first quarter of 2022, which will be key to understanding the economic viability of the blanket mineralization.

“The diamond drill results from the Alonso target suggest that the high-grade boulders that we see on surface at Alonso are not derived from the immediate vicinity and may have been eroded from a source that is located further away than we previously anticipated.

“The identification of a major gold anomaly in streams which is coincident with a major E-W trending magnetic anomaly, 750m north-east of Alonso, opens up the possibility of a more distal source for the high-grade boulders.

“The fact that our exploration team continues to identify highly prospective targets in parallel with the drilling efforts is very encouraging and demonstrates the enormous potential of the Cuiú Cuiú gold district.

“Cuiú Cuiú is a district which contains 43 mainly high-grade targets outside the two known gold deposits with resources. Cabral currently has four rigs turning on three separate targets.”

Alan Carter, Cabral Gold President and CEO

Alonso Area Diamond Drilling and Reconnaissance Exploration

The Alonso target is located approximately 3.4km SE of the MG gold deposit and is characterized by numerous high-grade mineralized boulders that were found on surface.

These boulders previously returned very high gold values of **11.3 to 200.3 g/t gold** (see press release dated February 11, 2020).

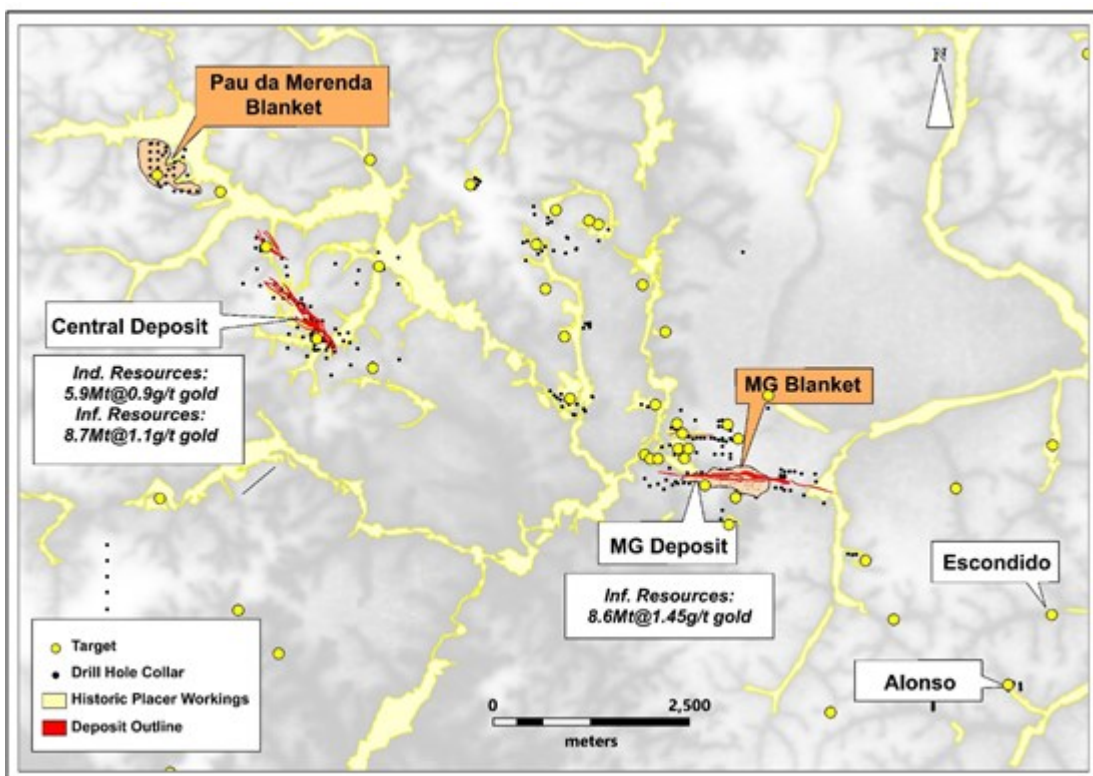

Figure 1: Map showing the location of the Alonso target and the major new Escondido gold anomaly in streams north-east of Alonso, as well as the MG and Central gold deposits and the

overlying MG gold-in-oxide target, as well as the Pau de Merenda (PDM) gold-in-oxide blanket and other key targets within this part of the Cuiú Cuiú district
