

I-80 Gold Finds More High Grade Mineralization at Ruby Hill

i-80 GOLD CORP. (TSX: IAU)

Reported the discovery of high-grade zinc mineralization from the first hole drilled to test the “Hilltop Corridor” at the Company’s 100%-owned Ruby Hill Property located in Eureka County, Nevada.

The first hole testing the Hilltop Corridor (iRH22-61) intersected high-grade mineralization grading **12.3% Zinc over 39.6 metres**.

I-80 GOLD DISCOVERS ADDITIONAL HIGH-GRADE MINERALIZATION AT RUBY HILL

Reno, Nevada, December 19, 2022 – **i-80 GOLD CORP. (TSX:IAU) (NYSE:IAUX) (“i-80”, or the “Company”)** is pleased to report the discovery of high-grade zinc mineralization from the first hole drilled to test the “Hilltop Corridor” at the Company’s 100%-owned Ruby Hill Property (“**Ruby Hill**” or “**the Property**”) located in Eureka County, Nevada.

In addition to work completed on gold targets, including the Ruby Deep deposit, the Company is drill testing multiple target areas for the potential to host polymetallic and base metal mineralization.

This program has yielded substantial success with three new discoveries having been made in the first dozen holes drilled. In addition to this new intercept within the Hilltop Corridor “South Blackjack” target, i-80 has announced the recent discoveries of high-grade, polymetallic CRD (Carbonate Replacement Deposit) mineralization in the Upper and Lower Hilltop Zones.

The first hole testing the Hilltop Corridor (iRH22-61) intersected high-grade mineralization grading **12.3% Zinc over 39.6 metres**.

This intercept is located approximately 300 metres southeast

of the Upper Hilltop Zone where recent drilling has returned high-grade mineralization including intercepts of: (See press releases dated August 30th, 2022 and [November 14th, 2022, here](#)).

The new intercept in the South Blackjack target is located approximately 450 metres to the south of the Blackjack deposit in an area where no previous drilling has been completed.

Hilltop Corridor

The Hilltop Corridor is an alluvial covered, structural trend, spanning several kilometres from the Archimedes pit to the nearby FAD deposit being drilled by Paycore Minerals and is believed to be host to multiple feeder fault structures.

This corridor is largely untested by previous drilling owing to the alluvial cover. Hole iRH22-61 is the first hole drilled to test this target, successfully intersecting high-grade zinc mineralization in the interpreted southern projection of the East Archimedes fault structure along the Graveyard Flats stock margin that returned an impressive interval of **12.3 % Zn over 39.6 m**.

This discovery is located approximately 450 metres south of known mineralization in the Blackjack (skarn) deposit that is currently being drilled by i-80 and located immediately below the Archimedes pit.

This new mineralized intercept is believed to represent either the southern strike extension of the Blackjack deposit or a new zone of skarn mineralization proximal to the Graveyard Flats intrusive complex.

If it is the strike extension of the Blackjack deposit, it

would increase the strike length of known mineralization from approximated 150 metres to a minimum of 600 metres. Drilling is currently underway at Blackjack and additional drilling will be completed in the vicinity of iRH22-61. [This target area remains open in all directions.](#)

Ewan Downie, CEO of i-80 Gold stated;

“Our ongoing drill program continues to confirm the substantial upside potential of the Ruby Hill Property with our new discoveries ranking amongst the highest-grade new discoveries being made anywhere in the world”.

“This property provides i-80 with significant optionality as it is host to oxide gold, sulphide gold, poly-metallic CRD and skarn base metal mineralization. All deposits are located in close proximity to the underground infrastructure being planned in 2023.”

Tyler Hill, Senior Geologist of i-80 Gold stated;

“We have realized unparalleled success in 2022 exploration campaign at Ruby Hill.

“Significant expansion at Ruby Deeps, new discoveries at Hilltop and now high-grade mineralization in the eastern portion of the Hilltop Corridor have made for an exciting year.

All deposits at Ruby Hill remain open for expansion.”

Hilltop Corridor Surface Plan

The Company is planning to add an additional core rig to accelerate the advancement of the multiple mineralized zones within the Hilltop Corridor and also to further test a new gold target recently identified by company geologists.

I-80 GOLD HILLTOP DISCOVERY YIELDS BONANZA-GRADE CRD MINERALIZATION AT RUBY HILL

*RESULTS INCLUDE 60.2 G/T GOLD, 908.7 G/T SILVER, 15.7 % LEAD
AND 1.1 % ZINC OVER 10.0 M*

*ALSO 1.9 G/T GOLD, 631.3 G/T SILVER, 33.0 % LEAD & 7.4 % ZINC
OVER 18.3 M*

[Download Press Release](#)

Reno, Nevada, November 14, 2022 – **i-80 GOLD CORP. (TSX: IAU)** (NYSE: IAUX) (“i-80”, or the “Company”) is pleased to report results from the first four holes drilled to follow-up the recently discovered Hilltop Zone that have confirmed high-grade, polymetallic CRD mineralization at the Company’s 100%-owned Ruby Hill Property (“Ruby Hill” or “the Property”) located in Eureka County, Nevada.

The discovery hole in the Upper Hilltop Zone returned an impressive **515.3 g/t Ag, 28.9 % Pb, 10.5 % Zn & 0.9 g/t Au over 28.3 m** in hole iRH22-43 (see press release dated August 30, 2022).

Results contained in this release are from the first four core holes drilled to follow-up this discovery (see Table 1) and additional drilling is being completed in both the Upper and Lower Hilltop horizons with assays pending.

Highlight results from recent core drilling in the “Upper Horizon” at the Hilltop target include:

iRH22-51

- 33.0 g/t Au, 3010.0 g/t Ag & 63.5 % Pb over 0.6 m and
- 3.1 g/t Au, 683.3 g/t Ag & 37.6 % Pb over 14.6 m

iRH22-53:

- 1.9 g/t Au, 631.3 g/t Ag, 7.4 % Zn & 33.0 % Pb over 18.3 m

iRH22-54

- 0.6 g/t Au, 374.1 g/t Ag, 3.9 % Zn & 20.2 % Pb over 20.8 m

iRH22-55:

- 60.2 g/t Au, 908.7 g/t Ag, 1.1 % Zn & 15.7 % Pb over 10.0 m
Incl. 83.2 g/t Au, 1261.0 g/t Ag, 1.5 % Zn, & 22.1% Pb over 7.0 m

Owing to this successful drilling at the Hilltop Zone, the program at Ruby Hill has again been expanded to facilitate additional step-out drilling at this target.

In addition to the Upper Horizon, drilling is testing the Lower Horizon (assays pending) where the initial hole intersected multiple zones of mineralization including **238.8 g/t Ag, 11.0 % Zn & 9.0 % Pb over 9.4 m and 469.5 g/t Ag, 11.8 % Zn & 18.2 % Pb over 2.1 m.**

Ewan Downie, CEO of i-80 stated;

“We believe that the grades of mineralization at Ruby Hill are truly world-class and the Hilltop Zone ranks amongst the highest-grade new discoveries being drilled anywhere on the planet”.

“Given its proximity to the underground infrastructure planned in 2023, the Hilltop Zone, when combined with the Blackjack deposit, is expected to be a major contributor to our future growth profile as we ultimately look to produce gold, silver and base metals.”

The Hilltop discovery is a new zone of mineralization, located approximately 400 metres southwest of the polymetallic Blackjack Zone (see Figures 1 and 2), immediately south of the Archimedes pit and proximal to the planned portal that the Company is advancing for construction. Mineralization consists of polymetallic carbonate replacement (CRD) in the form of massive and semi-massive sulphide and oxide mineralization containing high-grade precious metals and base metals. Continued definition and expansion drilling is underway and the horizon remains open along strike and at depth.

The Eureka (Ruby Hill) Mining District has a history of high-grade polymetallic CRD production that began in the 1860's and

spanned a period of more than one hundred years. Historic mined grades rank amongst the highest for any CRD district in the world. Since the 1970's, the CRD potential of the Eureka District has been largely overlooked in favour of exploration for Carlin-type gold deposits and the Company considers the opportunity to be substantial.

The Hilltop discovery opens up a structural corridor measuring greater than 1.5 km between the Archimedes pit and the original Ruby Hill Mine, which was previously underexplored due to post-mineral alluvial cover.

Mineralization in the upper horizon occurs immediately below alluvial cover at a depth of approximately 150 m. Geophysical surveys have been completed over the discovery area, including downhole electromagnetic (EM) and surface and induced polarization (IP) surveys, in an effort to identify additional massive sulfide targets.
