

Cabral Gold Drills 23.8m @ 5.5 g/t gold at Cuiú Cuiú

Cabral Gold Inc. (TSXV: CBR)

Announced assay results from three diamond-drill holes testing the Central gold deposit within the Cuiú Cuiú gold district in northern Brazil.

Highlights included Hole DDH250, which intersected 111.3m of nearly continuous mineralization from surface at the Central deposit, including 23.8m @ 5.5 g/t gold from 87.5m. [...]

Cabral Gold – MG Deposit, Para state, Brazil

Cabral Gold Drills 23.8m @ 5.5 g/t gold in Unoxidized Material and 84.9m @ 0.7 g/t Gold of Oxide Material at Central within the Cuiú Cuiú Gold District, Para State.

Vancouver, British Columbia – February 10, 2022 – **Cabral Gold Inc.** (TSXV: CBR) (OTC: CBGZF) (“Cabral” or the “Company”) is pleased to provide assay results from three diamond-drill holes testing the Central gold deposit within the Cuiú Cuiú gold district in northern Brazil.

Highlights are as follows:

- DDH250, intersected 111.3m of nearly continuous mineralization from surface at the Central deposit, including 23.8m @ 5.5 g/t gold from 87.5m, in hard unoxidized, brecciated and altered basement intrusive rocks including 0.7m @ 98.4 g/t gold from 87.5m, and 1.2m @ 51.0 g/t gold from 110.1m
- 84.9m @ 0.7 g/t gold from surface within oxidized rocks directly above the unoxidized mineralization, including 16.7m @ 0.5 g/t gold from surface in the gold-in-oxide blanket, and 68.2m @ 0.8 g/t gold from 16.7m in oxidized and weathered intrusive rocks
- DDH255 returned 37.0m @ 1.3 g/t gold from 42.0m in oxidized and weathered basement rocks, including 1.6m @ 13.0 g/t gold, from 44.0m. The hole also intersected 17m @ 0.2 g/t gold from surface within gold-in-oxide blanket material
- DDH258 also intersected 60m @ 0.8 g/t gold from 121.0m in hard brecciated and altered basement mineralization. The hole also returned a thin veneer of blanket cover, returning 5.8m @ 0.2 g/t gold from surface and 19.0m @ 0.3 g/t gold from 64.0m in oxidized weathered and mineralized basement rocks. The hole ended in mineralization grading 0.9 g/t gold, suggesting mineralization is open at depth

Cabral Gold management comments

“The results from the diamond drilling at the Central gold deposit are exceeding our expectations.

“There is clearly a thick zone of soft, weathered, mineralized gold-in-oxide material sitting directly above the primary Central gold deposit. Furthermore, these results confirm that significant zones of high-grade gold mineralization occur within the underlying, unweathered and hard basement gold deposit.

“With four drill rigs currently turning at Cuiú Cuiú, and several new discoveries within the district, notably at PDM and Machichie, we look forward to a very busy few months and a constant stream of drill results.”

Alan Carter, Cabral Gold President and CEO

Central Diamond-Drill Results

The Central gold deposit is located 2.5km SE of the PDM target (Figure 1) within the Cuiú Cuiú gold district.

Figure 1: Map showing the location of the Central gold deposit as well as the MG gold deposit, the PDM and MG gold-in-oxide blankets, and other key targets (yellow circles) within this part of the Cuiú Cuiú district.

Two rigs are currently operating at Central: an RC rig drilling shallow holes to assess the extent of the recently identified near-surface gold-in-oxide blanket (see press release dated January 27, 2022) and a diamond rig to better define the high-grade, highly altered, brecciated and sheared zones within the primary basement deposit as well as to test the near surface gold-in-oxide blanket.

Cabral Gold Trenching returns 5m @ 8.3 g/t gold

Cabral Gold Inc. (TSX.V: CBR)

Provided assay results from several trenches recently excavated immediately west of the main Machichie target within the Cuiú Cuiú gold district in northern Brazil.

Highlights were Trench CT35A, located 285m west of the most westerly drill hole at the main E-W trending Machichie main zone, returned 5m @ 8.3 g/t gold including 1m @ 37.8 g/t gold. [...]

Cabral Gold Trenching Program Extends Machichie 285m to West and returns 5m @ 8.3 g/t gold, Cuiú Cuiú Gold District, Brazil

Vancouver, British Columbia – February 2, 2022 – Cabral Gold Inc. (“Cabral” or the “Company”) (TSXV: CBR) (OTC: CBGZF) is pleased to provide assay results from several trenches recently excavated immediately west of the main Machichie target within the Cuiú Cuiú gold district in northern Brazil.

Highlights are as follows:

- Trench CT35A, located 285m west of the most westerly drill hole at the main E-W trending Machichie main zone, returned
 - 5m @ 8.3 g/t gold
 - including 1m @ 37.8 g/t gold
- The mineralization in CT35A is on strike and interpreted to represent the western extension of the E-W trending main Machichie mineralized structure. If proven correct, this would represent a 60% extension to the known mineralized zone at Machichie. This suggests that the Machichie main zone could extend for at least 800m along strike, whilst still being open to the west
- Trench CT36 completed 100m to the NE of CT35A also returned encouraging results in a new parallel structure at Machichie, including:
 - 0.6m @ 12.9 g/t gold,
 - 1.5m @ 1.6 g/t gold, and
 - 0.7 @ 1.1 g/t gold
- Further trenching in both areas is in progress in advance of planned follow-up drilling

Cabral Gold management comments

“The results from recent trenching west of the main E-W trending Machichie mineralized zone suggest there could be a significant extension to the zone as we currently know it, indicating a possible 60% addition to the strike length of the known mineralized structure.

“Whilst further trenching is ongoing and drilling is planned, this is a major development in our efforts to determine the size and scope of the mineralized zones at Machichie, which is located just 500m north of the MG gold deposit.

“It also adds further support to previous drilling which identified numerous near-surface high-grade vein structures in this area of the Cuiú Cuiú property.

“With the existing two gold deposits at MG and Central, the recent discovery of three near-surface gold in oxide blankets, and a new hard-rock mineralized zone at the PDM target, Cuiú Cuiú is rapidly emerging as a significant gold district, containing multiple zones of near-surface gold mineralization, which are all located in close proximity.”

Alan Carter, Cabral Gold President and CEO.

Machichie Trench Results

The Machichie target is located 500m north of the MG gold deposit (Figure 1).

It was initially discovered in 2019. Previous drilling at Machichie identified a persistent mineralized zone which is E-W trending, dips steeply to the north.

The main zone consists of a high-grade core zone surrounded by a low-grade alteration envelope. This is very similar to the style of primary bedrock gold deposits at MG and Central, as well as the recently announced PDM basement discovery (see press releases dated December 15, 2021 and January 12, 2022).

Figure 1: Map showing the location of the Machichie target and the existing MG and Central gold primary gold deposits, as well as the recently identified gold-in-oxide blanket and underlying mineralized zone in hard rock at the PDM target within the Cuiú Cuiú district. Other key targets are shown as yellow circles.

Cabral Gold Drills 55.1m @ 1.1 g/t gold including 5m @ 6.1 g/t gold, and Identifies a Third Gold-in-Oxide Blanket within Cuiú Cuiú Gold District

Vancouver, British Columbia – January 27, 2022 – **Cabral Gold Inc.** (“Cabral” or the “Company”) (**TSX.V: CBR**) (OTC: CBGZF) is pleased to provide assay results from an initial 12 RC drill holes and three diamond holes drilled within and above the Central gold deposit within the Cuiú Cuiú gold district in northern Brazil.

Highlights are as follows:

- DDH251, intersected gold-in-oxide mineralization at the Central deposit, and returned
- 55.1m @ 1.1 g/t gold from 4.9m depth
- including 5m @ 6.1 g/t gold
- and 15.5m @ 1.7 g/t gold from 65.8m depth
- and 3.5m @ 0.8 g/t gold from 81.3m depth in un-weathered and highly brecciate and altered intrusive rocks beneath the oxidation

- DDH247, also drilled at Central, returned 11.0m @ 0.7 g/t gold from surface, in gold-in-oxide blanket material, as well as 20.4m @ 0.5 g/t gold and 23.3m @ 0.3 g/t gold in un-weathered and highly brecciate and altered intrusive rocks further down the hole
- Results on an initial 10 shallow RC holes drilled within and around the northern part of the Central deposit, revealed a thin but consistent gold-in-oxide blanket. Results of note include RC259 which returned 26m @ 0.4 g/t gold in oxidized material from surface

Cabral Gold Management comments

“The results from the initial drilling at the Central gold deposit clearly demonstrate that we have a significant zone of gold-in-oxide mineralization forming a blanket above the primary Central deposit.

“This is the third gold-in-oxide blanket identified at Cuiú Cuiú since the initial discovery at MG in April of last year, and these recent discoveries are in addition to the two existing hard-rock deposits with resources at Cuiú Cuiú.

“At this stage, we do not know the extent of the blanket or how much of this material at Central is in-situ weathered primary gold mineralization, and how much is transported cover material.

“Nevertheless, both types of material are expected to add significantly to the inventory of potentially leachable gold-in-oxide deposits recently identified at MG and PDM.

“Additional drilling over the next months is expected to further define the limits of the oxide material at Central, whilst providing further definition of the high-grade zones within the underlying primary deposit at Central.”
